

CLOSURE SYSTEM AND METHOD OF MANUFACTURE

5

ABSTRACT

10 A closure system that combines a base tab with a stable carrier tab for supporting a fastening component and methods of manufacturing the closure system are disclosed. The carrier tab overlaps only one side of the base tab and is connected to the base tab by a bonding tape. The bonding tape is located over the inner edge of the carrier tab with a portion of the bonding tape being attached to the base tab and another portion of the bonding tape being attached to the carrier tab. As a result, a portion of the carrier tab is located between the bonding tape and the base tab.
